1. INSERT THE CLAMP

- Insert the wedge
- Align the tool slot of the bolt with the hole in the frame

2. BLOCK THE SEATPOST

- Insert seatpost
- Small adjustments of the wedge are sometimes required
- Adjust saddle height
- Make sure seatpost meets minimum insertion hole
- Using a torque wrench tighten the bolt to 9 Nm to fasten the seatpost

3. REMOVE THE SEATPOST

- Untighten the bolt until the seatpost is free to move

ATTENTION!

Opening the wedge too much can damage the frame!
The seatpost can get blocked even if the wedge gets blocked by untightening the bolt

DO NOT untighten more than it is necessary to remove the seatpost
